FbCalendar: Certification report

Overall result: failed

Report generated at 9/10/2013 5:11 AM UTC

Windows 8

Security tests: passed

This test scans your app for malware and unwanted behaviors. Learn more

Technical compliance: passed

This tests your app with the Windows App Certification Kit. You can also run this the test locally from the SDK. Learn more

Content compliance: failed

This test evaluates your software for content compliance with Windows Store Certification Requirements. Learn more

Your app doesn't meet requirement 1.2. Learn more

Questions to consider:
- Does your app require a user account? If so, you need to include a test account in the Notes to Testers field.
- Can users make purchases through the app? If so, you need to provide a way to test those purchases.

Commons reasons why apps fail this requirement:
- The app includes non-functional sections or contains placeholders (labeled "coming soon", "more to come", "not available yet" and so on) for primary user scenarios.
- The app doesn't work on all the architectures that it claims to support. For example, if you state that your app works on any CPU, it must work on all architectures, including ARM.
- The app description is misleading or vague.
- The app description uses screenshots or statements that imply features that don't appear to be implemented.
- The app doesn't respond to "play" and "pause" keyboard events to allow users to control audio playback.
- The app description doesn't explicitly state any hardware or network requirements.

Notes from Testers:
We were unable to connect to a service with provided account credentials. Frequently this happens because the credentials have expired or are locked or the service to which this App connects to was not up and running. This prevented us from completing our review of this App.
